The invention is used to diagnose or treat viral disease or disease
                                                     Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid sequences associated with tumor suppression, regres apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tuijnder

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid sequences associated with tumor suppression, apoptosis or virus resistance are useful to diagnose and treat disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20-MAY-2004

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase opposen kinase PKR genes, for treating cancer and inflammatory disease
                                                                   9
```

IJ NO 728; 317pp; English.

that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), (IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central carrous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, Clymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cestenosis or asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic crifts and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human NGGO crifts and mutations within diseased cells or to detect the presence of a condition of a target gene and as a diagnostic tool to examine genetic conditions. The receptor zinzyme substrate sequence. invention comprises nucleic acids (e.g. antisense oligonucleotides) þ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises nucleic acids (e.g. antisense oligonucleotides)
C that down regulate the expression or inhibit the function of a receptor
C for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
C invention are useful for treating: cerebrovascular accident, central
C nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC. lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC disease, lupus, multiple sclerosis, transplant graft rejection,
CC disease, lupus, multiple sclerosis, lupus, multiple sclerosis, transplant graft rejection,
CC disease, lupus, multiple sclerosis, transplant graft rejection,
CC disease, lupus, multiple sclerosis, lupu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                      antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cances melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthriti restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises nucleic acids (e.g. antisense oligonucleotides that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDE [kappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascullar accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obseity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, cc ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cuncleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR canberger constants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating: cerebrovascular accident, central CC invention are useful for treating: cerebrovascular accident, central CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC lymphoma or glioma), Crohn's disease, (inbetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulomephritis, sepsits, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC curietic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a craget RNA in a cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                           melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthrit restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or acopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or acopic dermatitis) the CC conditions for the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC target RNA in a cell. The present RNA sequence represents a human PKR CS substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

CC that down regulate the expression or inhibit the function of a receptor

CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),

CC IRAppaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

CC invention are useful for treating: cerebrovascular accident, central

CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,

CC restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis,

CC restenosis or asthma), Crohn's disease, diabetes, obssity, autoimmune

CC disease, lupus, multiple sclerosis, transplant/graft rejection,

CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

CC conditions of target gene and as a diagnostic tool to examine genetic

CC drifts and mutations within diseased cells or to detect the presence of a

CC conterpara commence of a target RNA in a cell. The present RNA sequence represents a human PKR

CC conterpara commence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC mucleic acids of the invention are also useful for down-regulating the
CC curression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR
CC substrace accounts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, hupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhimitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                              05-APR-2001; 2001US-00827395

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     XFFFFX8X55555555555555555555555555555
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), (IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, (Iymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crstenosis or asthma), Crohm's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NGG, prostaglandin D2 receptor (PTGRR), CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lugus, multiple sclerosis, transplant/graft rejection, cc conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cultifits and mutations within diseased cells or to detect the presence of a clarget RNA in a cell. The present RNA sequence represents a human PKR conhetrare ascommence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma). Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human PKR analysis of the present RNA sequence represents a human present RNA sequence represen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IJ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises nucleic acids (e.g. antisense oligonucleotides) (c) that down regulate the expression or inhibit the function of a receptor (or for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), (c) IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central corrections system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, (c) lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, ci sensemia/reperfusion injury, glomerulonephittis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic conditions and allergic rhinitis or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/repertusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cunditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR CC substrate segments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

```
Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                 õ

Claim 59; SEQ ID NO 2945; 317pp; English.

The invention comprises nucleic acids (e.g. antisense oligonucleotides) control that down regulate the expression or inhibit the function of a receptor (CC that down regulate the expression or inhibit the function of a receptor (CC control the function of a receptor (CC control the function are useful for treating: prostaglandin D2 receptor (PTGDR), CC control are useful for treating: cerebrovascular accident, central CC (CC control the function are useful for treating: cerebrovascular accident, central CC (CC control the function of the function are also useful for down-regulating the CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic conditions within diseased cells or to detect the presence of a condition of the function substrate sequence. a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGG, prostaglandin D2 receptor (PTGDR), I kappas kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC nucleic acids of the invention are also useful for down-regulating the CC mucleic acids of the invention are also useful for down-regulating the CC drifts and mucations within diseased cells or to detect the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR conhetter account.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR) IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, etchaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR target RNA in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            melanoma; lymphomā; gliomā; inflammatory disēase; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; asthma; allergic rhinitis; atopic dermatitis; human PKR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC flappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatici). The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatici). The
CC cucleic acids of the invention are also useful for down-regulating the
CC drifts and mutations within diseased cells or to detect the presence of a
CC target NAA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2660
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (by that down regulate the expression or inhibit the function of a receptor (or a neurite growth inhibitor, NOGO, prosteglandin D2 receptor (PTGDR), invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, schemaia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR target RNA in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NCGO, prostaglandin D2 receptor (PTGDR), CC IKappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the convention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC disease, lupus, asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis) the capmanary of the invention are also useful for down-regulating the conditions of a target gene and as a diagnostic tool to examine genetic conditions within diseased cells or to detect the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR cuberts as a company of the conditions of the invention are also useful for down and the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR cuberts as a company of the conditions of the invention are the company of the conditions of the condition

```

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase operatein kinase PKR genes, for treating cancer and inflammatory disease

õ

Claim 59;

SEQ ID NO 3509; 317pp; English.

comprises nucleic

acids (e.g. antis on or inhibit the

antisense

oligonucleotides)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), (C IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central controls system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, C Iymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cc ischaemia/reperfusion injury, spinal cord injury, cancer (e.g. melanoma, C disease, lupus, multiple sclerosis, transplant/graft rejection, cc ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the capression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), I RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of the invention are also useful for down-regulating the presence of the invention are also useful for down-regulating the symptomic detect the presence of the invention are also useful for down-regulating the presence of the invention are also useful for down-regulating the symptomic detect the presence of the invention are also useful for down-regulating the presence of the invention are also useful for down-regulating the symptomic detect the presence of the invention are also useful for down-regulating the presence of the invention are also useful for down-regulating the symptomic detect the presence of the presence of the presence of the invention are also to detect the presence of the presence of the presence of the invention are also to detect the presence of the

RNA in a cell. The present RNA sequence represents a human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGPR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human IKX-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                     05-APR-2001; 2001US-00827395

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, hupus, multiple sclerosis, transplant/graft rejection, edisease, hupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR enthers of accuracy.
                                                                                                                                                                                                                                                                                                                                             antisense oligonucleotide; neurite growth inhibitor; NOGO; prostsglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cance; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthrit: restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of a
```

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

Claim 59;

SEQ ID NO 2984; 317pp; English.

comprises nucleic acids (e.g. antisense oligonucleotides) late the expression or inhibit the function of a receptor

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase opposein kinase PKR genes, for treating cancer and inflammatory disease
                                                                                                                                               Claim
                                                                                                                                               SEQ ID NO
                                                                                                                                               3947; 317pp; English
                                                                                                                                                                       Ö
```

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC curber solds of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC curber rate securace substrate sequence.

that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), it is a neurite growth inhibitor. NOGO, prostaglandin D2 receptor (PTGDR), it is a neurite growth inhibitor. NOGO, prostaglandin D2 receptor (PTGDR), it is a neurite growth inhibitor. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restences or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGG, prostaglandin D2 receptor (FGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemial, repertusion injury, glomerulonephritis, sepais, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the

The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protain kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cance melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthrit restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple scerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (programment of a neurite growth inhibitor, NOCO, prostaglandin D2 receptor (program, for a neurite growth inhibitor, NOCO, prostaglandin D2 receptor (program, for a neurite growth inhibitor, NOCO, prostaglandin D2 receptor (program, for a neurite growth inhibitor, NOCO, prostaglandin D2 receptor (program, neurite growth) and programment of the programment of the neurite growth of the programment of the neurite growth of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of a
```

WPI; 2003-058513/05

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

Claim 59;

SEQ ID NO 3455; 317pp; English.

comprises nucleic

acids (e.g. antisense on or inhibit the funct

function of a receptor fine no receptor (PTGDR),

oligonucleotides)

The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGRR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lugus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cucleic acids of the invention are also useful for down-regulating the CC quietession of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC target RNA in a cell. The present RNA sequence represents a human PKR Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease SEQ ID NO 3724; 317pp; English 9

that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), it is a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), it is a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), it is a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), in the most of the injury, spinal cord injury, cancer (e.g. melanoma, inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (pTGDR), for a neurite growth inhibitor, NOGO, prostagiandin D2 receptor (pTGDR), IkappaB kinase (IKK), or protein kinase pRR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cestenosis, untiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a theretals accell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR),
CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC Invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC custression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC custretrate acruance.

CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating; cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhintis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhintis or atopic dermatitis). The CC nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC substrate seminare.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR) IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. returnated arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, hupus, multiple sclerosis, transplant/graft rejection, sections, autoimmune disease, multiple sclerosis, transplant/graft rejection.
                                                                                                                                                                                                                                                                                      antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cances melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthriti restenceis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGDR), CC IKappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the convention are useful for treating: cerebrovascular accident, central corrous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cc restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cc disease, lupus, multiple sclerosis, transplant/graft rejection, cc disease, lupus, multiple sclerosis, transplant/graft rejection. The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The curleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

WPI; 2003-058513/05

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

Claim 59;

SEQ ID NO 2971; 317pp; English.

comprises nucleic acids (e.

g (e.g. antisense oligonucleotides) inhibit the function of a receptor prostaglandin D2 receptor (PTGDR)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NGCO, prostaglandin D2 receptor (PTGDR), IsappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, species, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

SEQ ID NO 2991; 317pp; English

The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NoGO, prostaglandin D2 receptor (PTGDR), CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC mucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cuberters accuracy. substrate sequence. מ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 2681
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor (For a neurite growth inhibitor, NGG), prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the convention are useful for treating: cerebrovascular accident, central conventions of the injury, spinal cord injury, cancer (e.g. melanoma, CC ischaemia/reperfusion injury, glomearulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC nucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a charget RNA in a cell. The present RNA sequence represents a human PKR contents and a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid molecule that down-regulates CC expression of Grb2-related with insert domain (GRID) gene, e.g. a CC hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, C amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell CC including the novel nucleic acid molecule, reducing GRID activity in a CC cell by contacting the cell with the novel nucleic acid molecule, retreating a patient having a condition associated with the level of GRID CC (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, an expression CC contacting the cell with the novel nucleic acid molecule, an expression CC contacting the cell with the novel nucleic acid molecule, an expression CC contacting the cell with the novel nucleic acid molecule in a manner that allows its expression; a CC mammalian cell including the expression vector and an enzymatic nucleic acid molecule is useful for treating a condition associated with the level of CC GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is CC a target region for the enzymatic nucleic acids of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

This invention relates to a novel method of diagnosing a predisposition to fat deposition, leanness or non-insulin dependent diabetes mellitus (NIDDM) in a subject. The method comprises detecting the presence or absence of a polymorphic variation associated with fat deposition,

associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene. VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant

diseases

invention relates to a kit for diagnosing and treating ociated diseases which comprises a panel of nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleotide sequence in a nucleic acid sample from a subject. The invention may be useful for the development of compounds with an antidiabetic or anorectic activity. The method is useful for diagnosing a predisposition to fat deposition, leanness or NIDDM. The nucleic acid encoding the polypeptide is useful for diagnosing conditions or diseases including fat deposition or NIDDM, also in treating diabetes and obesity. The present sequence is that of an oligonucleotide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                               Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome; allergy; type II hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; leprosy; infectious disease; viral infettion; fungal infection; Candida; parasitic infection; schistosome filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       និនិនិនិនិនិនិនិនិនិនិនិនិនិនិនិ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             including autoimmune diseases, degenerative nervous system diseases, correct versus host disease, hypersensitivity diseases, infectious diseases, and neoplastic diseases. Autoimmune diseases include Addison's disease, attophic gastritis. Degenerative nervous system diseases include multiple selevous and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to conform the proof of the syndrome and Type II hypersensitivities such as those present in condestrure's syndrome and Type II hypersensitivities such as those caused by caused by viruses such as HIV, fungal infections such as those caused by caused by viruses such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, contact of the present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                         cc including auto-immune diseases, degenerative nervous system diseases, cc graft versus host disease, hypersensitivity disease, infectious diseases cand neoplastic diseases. Autoimmune diseases include Addison's disease, cc antrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type cc I hypersensitivities such as contact with allergens that lead to cc allergies. Type II hypersensitivities such as those present in cc Goodpasture's syndrome and Type IV hypersensitivities such as those caused by circuses such as HIV, fungal infections such as those caused by contact and bacterial infections such as those caused by contact and bacterial infections such as those caused by contact and bacterial infections such as those caused by Cc schistosomes, filaria and bacterial infections such as those caused by contacterium. Neoplastic diseases include lymphoproliferative diseases che as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

                     This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the celetion indicates a predisposition to breast and ovarian cancer. The present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polymucleotide is a mutant that arises as a result of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of the RNA; converting the single-stranded cDNA into double-stranded cDN to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription from a polynucleotide template. The method inhibits the undesired nontemplate derived production of RNA in the transcription reaction. Sequences ADJ34483-ADJ34489 represent oligonucleotides used in a T7 RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SXS
Cr The present invention describes a method (M1) for aiding in the diagnosis of glioma. (M1) involves detecting an expression product of at least one crosses of the present in a first brain tissue sample (T) suspected of being created by there (I) is chosen from any one of 255 genes (glioma comparing the expression of (I) in (T) with expression of (I) in a second normal brain crissue sample (R), where increased expression of (I) in a second normal brain creating (M2) glioma involves contacting cells of the glioma with an creating (M2) glioma involves contacting cells of the glioma with an creating involves contacting cells of the glioma with an creating involves contacting a test compound with the cell which expresses (I), monitoring an expression product of the at least one gene and creatifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound creating involves contacting a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying the test compound creating involves contacting a test compound creating involves contacting a test compound with the cell which expresses mRNA of at least one gene. Creating into the cell which expresses mRNA of at least one gene. Creating into the cell which expresses mRNA of the gene, and compound as a potential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

XX ADK13 The present invention describes a method (M1) for aiding in the diagnosis of glioma. (M1) involves detecting an expression product of at least one gene (I) in a first brain tissue sample (T) suspected of being neoplastic, where (I) is chosen from any one of 255 genes (glioma endothelial markers (GEMs)) as given in specification, and comparing the expression of (I) in (T) with expression of (I) in a second normal brain tissue sample (R), where increased expression of (I) in (T) relative to (R), identifies (T) as likely to be neoplastic. Also described: (1) treating (M2) glioma involves contacting cells of the glioma with an antibody that specifically binds to a extracellular epitope; (2) identifying (M3) a test compound as potential antiancer or antiglioma identifying (Ndrug involves the diagnosis at least one

```
CC (1), monitoring an expression product of the at least one gene and contential anticancer drug if it decreases contential anticancer or antiglioma drug involves contacting a test compound as a potential anticancer drug if it decreases compound with the cell which expresses mRNA of at least one gene; (3) identifying the test compound as a potential anticancer drug if it compound with the cell which expresses mRNA of at least one gene contential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and corresponse to glioma involves administering to a mammal, a protein cor (1). (1) have cytostatic activities, and can be used to trigger immune destruction of glioma cells, and as immune response inducers. (M1) is continue response to glioma in alman. (M5) is useful for treating multice drug sensitive glioma in a human. (M5) is useful for treating an immune compones to a glioma in a mammal having glioma or in a mammal who has had a glioma surgically removed. The present sequence represents a human GEM consisting of the control of the exemplification of the
invention.

Diagnosing glioma by detecting expre genes, glioma endothelial markers, i tissue sample. expression product of any one of 255 ers, in brain tissue sample suspected of the expression with expression in norm normal

2 SEQ ID NO 408; 114pp; English

The present of glioma. (I gene (I) in neoplastic, It invention describes a method (M1) for aiding in the (M1) involves detecting an expression product of at n a first brain tissue sample (T) suspected of being where (I) is chosen from any one of 255 genes (glick where (I)) is chosen from the context of the chosen from the context of the chosen from the context of the chosen from th (glioma at least diagnosis

brain tissue sample.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ADK13251/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  dentifying (M3) at test compound as potential anticancer or antiglioma (I), monitoring an expression product of the at least one gene and identifying test compound as a potential anticancer or antiglioma (I), monitoring an expression product of the at least one gene and identifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound can be potential anticancer or antiglioma drug involves contacting a test compound with the cell which expresses mRNA of at least one gene; and dentifying the test compound as a potential anticancer drug if it can be expressed on a taleast one gene; and (4) inducing (M5) an immune response to glioma involves administering to a mammal, a protein cor (I). (I) have cytostatic activities, and can be used to trigger immune con (II) have cytostatic activities, and can be used to trigger immune con (II) for aiding in diagnosing glioma. (M2) is useful for treating multicating sensitive glioma in a human. (M5) is useful for treating multicating apidema in a mammal having glioma or in a mammal who has had can place and surgically removed. The present sequence represents a human GEM construction of the expression of the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

cc of glioma. (M1) involves detecting an expression product of at least one cg gene (I) in a first brain tissue sample (T) suspected of being compopulatic, where (I) is chosen from any one of 255 genes (glioma comparing the expression of (I) in (T) with expression of (I) in a second normal brain ctissue sample (R), where increased expression of (I) in (T) relative to compositive to the compositive to the specifically binds to a extracellular epitope; (2) compositive contacting (M2) glioma involves contacting cells of the glioma with an contentifying (M3) a test compound as potential anticancer or antiglioma contacting a test compound with the cell which expresses contacting an expression product of the at least one gene and contential anticancer or antiglioma contential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M3) a test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M3) a test compound contential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound contential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and contential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and contential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and contential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and contential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and inducing (M5)
or (1). (1) have cycostatic activities, and can be used to trigger immune destruction of glioma cells, and as immune response inducers. (M1) is useful for aiding in diagnosing glioma. (M2) is useful for treating multi-drug sensitive glioma in a human. (M5) is useful for inducing an immune response to a glioma in a mammal having glioma or in a mammal who has had a glioma surgically removed. The present sequence represents a human GEM long tag oligonucleotide, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method (M1) for aiding in the of glioma. (M1) involves detecting an expression product of at gene (I) in a first brain tissue sample (T) suspected of being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 2; SEQ ID NO 429; 114pp; English

The vector (B), also polypeptides (II) encoded by (I), are used for treatment of breast cancer. Arrays based on (I), (II), or their fragments, and (II) -specific antibodies (Ab) are used to predict characteristics (e.g. invasiveness or stage) of breast cancer, and (I), or its fragments, are used to modulate characteristics of such cells; to identify breast cancer genes and to detect breast cancer (by detecting polymorphic nucleic acid or its products). The present sequence represents a human ER+ breast cancer differentially expressed sequence.
              of a late-onset neurodegenerative disease to a patient which comprise analysing a sample from the patient to determine whether the patient a D-amino acid oxidase (DAO) abnormality, where the presence of a DAC abnormality is an indication that the patient has an increased risk capacity is an indication that the patient has an increased risk capacity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          flavin dinucleotide; FAD-dependent oxidase; D-amino acid oxidative deamination; EC.1.4.3.3; neuroprotective; antiparkinsonian; amyotrophic lateral sclerosis; ALS; Parkinson' Alzheimer's; gene therapy; human; ss; PCR; primer; linkage analy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vector containing nucleic acid associated with breast cancer, useful treating, diagnosing and characterizing breast cancer, also related polypeptides and antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (PAD)-dependent oxidase which catalyses the oxidative deamination of D-amino acids (BC.1.4.3.3). The method of the invention has neuroprotective and antiparkinsonian applications and may be useful in determining an increased risk of a late-onset neurodegenerative disease to a patient, as well as in preparing a medicament for treating a late-onset neurodegenerative disease, such as amyotrophic lateral sclerosis (ALS), Parkinson's disease (PD) or Alzhesimer's disease (AD), possibly via gene therapy. The current sequence is that of a PCR primer of the invention which was used during linkage analysis of human D-amino acid oxidase.
                                    The present invention provides a system for the production of nucleic acids with reduced levels of intramolecular base pairing (secondary structure) and intermolecular base pairing by generating unstructured nucleic acids (UNAs). The invention is useful for generating nucleic acid having a reduced ability to hybridise. The invention is also useful in molecular biology and nucleic acid chemistry. The present sequence is an annealing primer used to generate single-stranded labelled unstructured nucleic acid (UNA) by polymerase extension reaction (PCR). This sequence

                                                                                                                                          The invention relates to a sensor array system for remote characterizing gaseous or vapor sample, has several sensors providing detectable signal on contacting analyte and each sensor has nucleic acid/fluorophore combination, measuring apparatus measures detectable signal, transmitting device transmits information with respect to detectable signal to remote location through internet, and computer having residential algorithm for characterizing analyte. (1) is useful in monitoring chemical hazards, air quality, and medical conditions, and detecting explosives, mines, and hazardous chemicals. (I) or (II) is useful in transmitting identified information on various odors or smells, e.g., vapor or gaseous analytes through internet. This sequence represents an oligonucleotide used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a subject at risk of breast cancer by detecting to or absence of one or more nucleotide polymorphic variations, diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         breast cancer; cytostatic; gene therapy; GP6; GPIV; GPVI; chromosome 19q13.4; ss;

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically. target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromograpin B (CHGB; secretogranin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosts, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human NUMA1/FLJ20625/LOC220074 region gDNA. FLJ20625 and LOC220074 have been mapped to chromosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPKLO, KIAAO861, NUMAI or GALE regions which are associated with breast cancer in a nucleic acid sample from a subject.
                                                                                                               WPI; 2004-487902/46.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        endometrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, brain and CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer, hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer, testicular cancer, as well as other carcinomas and sarcomas. The invention is also useful in gene therapy. The present sequence is a CpG immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a class of CpG immunostimulatory or oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, breast cancer, cervical cancer, choriocarcinoma, toolon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                CpG immunostimulatory oligonucleotide; immune response; allergy; asthma; viral infection; bacterial infection; cancer; lymphoma; intraepithelial neoplasm; melanoma; neuroblastoma; Hodgkin's lymphoma; carcinoma; sarcoma; gene therapy; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              XSSSSSSSSSSSSSSSSXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a class of CpG immunostimulatory
CC coligonucleotides containing a 5'7GC motif or a CG at or the 5' end that
CC compositions of the invention are useful for treating allergy or asthma,
CC viral and bacterial infections and cancer e.g. biliary tract cancer,
CC viral and bacterial cancer, choriocarcinoma, colon cancer,
CC breast cancer, cervical cancer, lymphomas, intraepithalial neoplasms,
CC invercancer, lung cancer (e.g. small cell and non-small cell), melanoma,
CC cendometrial cancer, pancreatic cancer, prostate cancer,
CC rectal cancer, sarcomas, thyroid cancer, cancer, bone cancer, brain
CC and CNS cancer, connective tissue cancer, ceaplageal cancer, eye cancer,
CC testicular cancer, larynx cancer, oral cavity cancer, skin cancer,
CC testicular cancer, as well as other carcinomas and sarcomas. The
CC invention is also useful in gene therapy. The present sequence is a CpG
CC immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

AAI73060 to AAI79867 represent isolated human polymorphic polymucleotide sequences (1), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53229 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (1) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (1) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                              Claim 1; Page 1026; 2653pp; English

                         nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's diseases, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymorphic polypeptides.
                                                                                                                                                                                                                                                                                Isolated human polymorphisms,
                                                                                                                                                                                               The present invention relates to human nucleic acids containing single

                                                                                                                                                                                                          AAI73060 to AAI79867 represent isolated human polymorphic polymucleotide consequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM5329 represent peptides related to human polymorphic consequences. The sequences can be used in gene and protein contempy, and in vaccine production. (I) and the polypeptides encoded by consequences with inappropriate expression of polymorphic polypeptides. For consequences in a patient's genome that affect the activity of polypeptides or consequences may also be used as DNA probes in diagnostic assays to detect consequences may also be used as DNA probes in diagnostic assays to detect constitute the presence of similar nucleic acids in samples, and consequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and constituted the presence of similar nucleic acids in samples, and constituted the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of similar nucleic acids in samples, and constitute the presence of polymorphic polymorph

                                                                                                                                                                             The present invention describes a set of regulatory single nucleotide CC polymorphism (SNP) polymucleotides or its complementary set of conjunctive polymucleotides of at least 6 contiguous CC polymucleotides comprising polymucleotides of at least 6 contiguous CC snp with 5' and/or 3' genomic flanking sequence. A set of regulatory SNP CC snp with 5' and/or 3' genomic flanking sequence. A set of regulatory SNP CC polymucleotides contains several regulatory SNPs which collectively map CC to several transcription factor binding site cluster (TFC) sequences so CC that each SNP lies within a TFC sequence, and a genomic nucleic acid contents of complementary except for the SNP, to a portion of a genomic concluded acid sequence from 30 nucleotides 5' to 30' nucleotides 3' to the TFC sequence. The set of regulatory SNP polymucleotides can be used in CC gene therapy. The regulatory SNP polymucleotides can be used in CC gene therapy. The regulatory SNP polymucleotides are useful in diagnostic polymucleotides are also useful as probes or primers for detecting the conjuncted sare also useful as probes or primers for detecting the conjuncted comprising a SNP, which is used in an example from the conjuncted tide comprising a SNP, which is used in an example from the
                                                                               Query Match

                                                                                                                                                                                                                                                                                                     AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and

SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer

The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRMS) polymucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRMS gene or its fragment, or a CC polymorphic variant of a reference sequence for a CHRMS cDNA or its CC fragment. The invention is useful in drug screening assays. The molecules CC CHRMS, and in expressing CHRMS protein for use in screening for candidate drugs to treat diseases related to CHRMS activity. The methods of the cinvention are useful in developing diagnostic tests and therapeutic creatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRMS activity and is useful in determining whether an individual caseful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping the CHRMS gene in an individual. The present mucleic acid sequence concepts (ABK81765-ABK81774) that were used in the invention to detect to polymorphisms in the human CHRMS gene
